- No. The guard will not at the guard house at the end of the inspection
- The route must use each street exactly once, so it will not go back to guard at the end
- This is a Euler Trail because it has vertices having odd degree. Euler trail is a graph that start and end at different vertex but use every edge exactly once.

2

(b) Cannot. If the security guard want to visit each street intersection for the neighbourhood exactly once to switch off the street light before they end the night shift beginning and ending at A, it should has an Hamiltonian circuit.
But he need repeated visit one of the street intersection to form a circuit.
Thus, it is not halmiltonian circuit.

4a. This is because not all vertices are connected together.

b. $CD=1$ $FJ=7$

$$\text{Length} = 1+2+2+4+4+7+8+9 = 37 \text{ meters}$$

$$\text{Total cost} = 37 \times 100 = \text{RM}3700$$

c. Yes, there are more than one distinct MST obtained for the Figure 4. *justifying was*

\therefore Input string that can be accepted = 0111.

7. Let $M = \{S, I, O, q_0, f_s, f_o\}$

where $S = \{q_0, q_1, q_2\}$ (q_0 means ground floor, q_1 means floor 1, q_2 means floor 2)

$I = \{0, 1, 2\}$

$O = \{0, 1\}$ (0 means no change, 1 means goes up or goes down)

q_0 = initial state
